

# MAY SEEK MOTOR PATENT.

## M. C. Kelly to Ask Five Scientists to Test Hendershot Device.

PITTSBURGH, Nov. 11 (AP).—Representative M. Clyde Kelly of Pennsylvania, it became known here today, plans to seek a Congressional patent for the "fuelless" motor of Lester J. Hendershot of West Elizabeth, Pa., if five scientists approve the invention as practical. A Congressional patent gives the patentee full protection for seventeen years.

Hendershot's invention, which he describes as a "magnetic induction" motor, was first announced in March. At that time in some quarters it was regarded with skepticism.

The motor, according to its inventor, is without visible means of power. It obtains its initial impulse, Hendershot maintains, from a pre-charged magnetic core, and its secondary and greatest power pulse by magnetic induction, from the earth.

Hendershot today said several of his motors had been built here, and that one, which developed sixty horsepower, had been in operation recently for two weeks without re-charging the magnetic core.
